

# febi 172620

**To Fit:**

MAN TGA, TGS, TGX, Bus

NEOPLAN Centroliner, Jetliner, Trendliner

Repl. no. 51.01804.6002

## Keeping it Clean with febi Air Filters for Crankcase Ventilation

During combustion in the combustion chamber of a piston engine, combustion gases, also called blow-by gases, escape via the piston rings into the crankcase. To prevent the pressure in the engine from becoming too high, these gases are discharged into the engine's intake tract. They contain oil mist, which in the long run can contaminate and coke the intake tract and cause problems, for example with the EGR valve.

The air filter for crankcase ventilation febi 172620 prevents the blow-by gases from the crankcase, which are contaminated with engine oil mist, from being conducted unfiltered into the intake tract by filtering out the fine oil droplets. The oil filtered from the air is returned to the oil circuit, efficiently reducing oil consumption and overall engine emissions while keeping the intake system clean.

In addition to air filters for crankcase ventilation, febi offers a wide range of filters in OE matching quality for all common applications in the commercial vehicle sector.
